

LDDFLASH™

Enterprise-Enforced Flash Use & Security Policy

part of the **Lost Data Destruction®** family of PC data security products

This little device

may be your biggest data loss vulnerability.

USB Port Blocking

Small and portable, flash devices are ideal for transporting, backing up and sharing business data. These miniature devices are so inexpensive and ubiquitous that employees often carry their own. Unfortunately, these popular storage devices used without oversight may very well represent your company's greatest threat for a catastrophic data breach. LDDFLASH from Beachhead gives your business the ability to automatically enforce flash device use and security policy company-wide. Better yet, because LDDFLASH is a subscription-based (SaaS) service, the solution can mitigate your risk company-wide in a matter of hours.

Part of the Lost Data Destruction® (LDD) family of data security products from Beachhead Solutions, LDDFLASH delivers enforced encryption and destruction of at-risk data to any flash device used to backup or transport valuable business data. Most importantly the rules and restrictions that define flash data storage – if such devices can be used at all – is determined solely by the business/risk decision makers, not your users.

Effective Security Must be Automated and Easy to Manage

Like all LDD products, LDDFLASH represents an easier approach with which to manage and secure valuable business data. An add-on subscription service (SaaS) to LDD, LDDFLASH seals the data proliferation and leakage vulnerability associated with USB ports. Rules for if, how and which security measures are to be used are created by the LDD administrator through the secure web-based console and are remotely distributed to your community of PCs. LDDFLASH will immediately begin to enforce your security and flash usage policies.

A truly unique approach to flash data security, you'll benefit from:

Software as a service (SaaS), subscription-based service gives immediate protection without investment in hardware or software infrastructure.

Remote mass deployment enterprise-wide quickly and automatically secures data on any flash device connected to your PCs.

Encryption & Destruction of At-Risk Data

Easy administration with Web 2.0 interface for straightforward monitoring and control.

Easy upgrade for LDD customers with a simple and quick online upgrade.

Unmatched Security and Limitless Flexibility

LDDFLASH, like LDD, draws upon a comprehensive set of easily managed tools including encryption and data elimination. When used together, these tools allow you to tailor policies that minimize company security concerns without compromising employee productivity.

Password-Enabled Device Sharing

Sample Flash Device Use & Security Policies

Desired Policy	Achieved By
Prohibit use of flash devices to contract employees	USB port blocking enforced on this group of personal computers
Ensure data is inaccessible on lost & stolen flash devices	Enforced data encryption on contents of flash device
Under threat, disable access to data on flash device to ALL users	"Quarantine" data and restore access to authorized user through "challenge response" authentication
Monitor transfer & proliferation of sensitive data on flash devices	"Flash Data Auditing" lists files names moved to encrypted flash devices
Restrict flash device data sharing only to authorized users	Password-based authentication privileges unlock device contents

Quick Deployment Means Immediate Piece of Mind

The LDD family of PC data security products gives organizations the control necessary to manage and secure valuable business data on PCs and USB Flash devices. All Beachhead products, including LDDFLASH, are unmatched in speed of deployment, ease-of-management and data security automation. As a result, LDD products provide immediately recognized value.
